

Mix and match

Proper control and effective cost management of fleet operations is heavily dependent on information available to the fleet manager, and MiX Telematics has taken its information provision a step further through a partnership with Intellichain, a South African-based software solution company that focuses on supply chain execution and fleet management.

In conjunction with MiX Telematics fleet management solutions, customers can now benefit from end-to-end integrated supply-chain management solutions that incorporate modules such as asset management, driver management, fuel management, stock management, routing

and scheduling and transport execution management.

Gert Pretorius, managing director of MiX Telematics, says, "In addition, the bespoke integration development capability, expected to result from the partnership, will lead to a streamlined, integrated and customised solution for our customers, between their new and existing hardware and software systems. The value-add service will enable our commercial fleet customers to optimise their business processes accordingly."

"An intelligent technology approach and better use of realtime tracking information, equips customers in the supply-chain arena with evolving functionality, and provides

them with a single view across their operation, enabling effective management of operations and continuous business growth," says Willem Cilliers, managing director of Intellichain.
